GEMWATT

# Tester guide

Thank you for joining the test. This page explains what the app does, what we ask of you, and how to do it without getting stuck.

## What Gemwatt is

An app for Tesla owners that shows battery health, energy use, trips, charging and what it all costs. It **only reads data** from the car: it never locks, unlocks or controls anything.

## What we are testing

We want to confirm the whole path works with real cars: **sign-in, connecting the car, receiving data, and the subscription**. There are no right answers. Anything confusing or broken is exactly what we are looking for.

## What to do, step by step

1. **Install the app** from the test link we will send you separately. Your phone must be signed in to Google Play with the same Google account whose email you gave us.
2. **Sign in with Google** ("Continue with Google").

3. **Connect your car:** tap "Connect my car". Your browser opens Tesla's own sign-in page. You type your password only there; Gemwatt never sees it. Tesla asks you to approve access to the data (including location, if you want trips on a map).
4. **Approve the key on the car:** the app shows "One step to record your drives". Tap "Open the Tesla app", approve adding Gemwatt as a key, then tap the key card on the car's centre console. This is a one-time step. The key is used only so the car can send its readings, not to control it.
5. **Use it normally:** drive and charge as you always do. Trips and charges are recorded by themselves.
6. **The subscription:** a screen shows "7 days free". Tap "Start free trial" and complete Google Play's payment sheet. **You are not charged at all in this test**: it shows a "Test card" and the subscription opens at no cost. That is how we verify payments work.

**Important:** for the test to count you must **stay opted in for 14 days in a row** (do not leave the test or uninstall the app) and open the app now and then.

## What to report

- Anything that failed or crashed, and what you did just before.
- A step that was unclear, or text you did not understand.
- A number that looks wrong (range, battery percent, a trip that was not recorded).
- How the subscription and payment screen felt.

Email us at **support@gemwatt.com**. A screenshot helps a lot. There is also a **demo mode** ("Try the demo") on the sign-in screen that shows the app with sample data.

## Privacy and control

- You can **remove the key** from the car at any time: Controls → Locks → Keys.
- You can **delete your account and data** in the app: More → Settings → "Disconnect and delete my data".
- No ads, no selling of data. Full policy: gemwatt.com/privacy
